Reasons For Allowance

1. The following is an examiner's statement of reasons for allowance: Ortscheid et al. (U.S. Patent No. 6,647,248) teach a cradle that secures a removable device, a body, two side surfaces and two face surface are provided on one face surface, and a movable hook is provided on the other face surface. At least one of the surfaces which has a different designation than the surfaces on which the tabs and hook are located, is equipped with a button, one end of which is equipped with a first slide surface. A slider is provided whose one end has at least one second slide surface and whose other end engages the movable hook(s). Lee et al. (U.S. Patent No. 6,134,421) teach a cradle can be mounted in a vehicle, or other suitable location, for supporting a wireless dual-frequency telephone that includes an antenna. The cradle includes a plastic housing and a ground plane disposed in the housing. A trough-shaped feed coupler element is electrically connected to matching circuits and an input/output connector. A first parasitic coupler element is aligned with the feed coupler element, and connected to the ground plane, and electromagnetically couples signals having a first frequency to and from the antenna. However, prior art of record fails to teach, or renders obvious, alone or in combination, a fixed base assembly of mobile phone comprising a base, a cylinder extended upward from the center of the top of the base having one end coupled to a connecting rod, and the other end of the connecting rod able to clamp a mobile phone, wherein the bottom of the base is hollow and connected to the inside of the cylinder, such that the base can be slid, expanded, or contracted up and down along the cylinder. A sucking disc, having an external diameter slightly larger than or equal to the external diameter of the bottom of the base, and a bar-shaped pillar being extended upward from the center of the sucking disc, such that the base being slidably disposed on the sucking disc, and

a spring surrounding the periphery of the bar-shaped pillar, such that the base being capable of sliding by expanding and contracting up and down along the pillar, and the pillar comprising a through hole along the direction of the diameter. In addition, a clicking member is extended from the cylinder and the base, having a pair of corresponding arm sections disposed at a pivotal coupling end of said clicking member, and the pivotal end of the clicking member symmetrically has a circular protruded head section such that when the clicking end of the clicking member is pressed, the head section of the clicking member presses against the surface of the base to lift the sucking disc of the cylinder, and make the bottom of the sucking disc vacuum and attached onto a fixed object as directly claimed in independent claim 1.

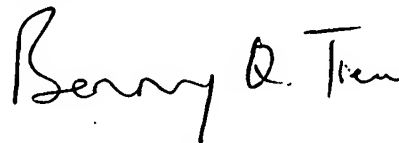

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
